#### Abstract

This paper presented the integration of (Analytic Hierarchy Process) AHP and (Technique of Order Preference by Similarity to Ideal Solution) TOPSIS in material selection process of an automotive fender design. The selection of material for automotive fender focused on lighter materials due to new trend in producing light weight vehicles in automotive industry. The main objective was to determine the best material for automotive fender using the integrated AHP-TOPSIS approach by identifying important criteria in material selection of the automotive fender. The important criteria considered were Performance, Cost, Weight and Manufacturing criteria. Three different types of material categories were considered namely High Strength Steel, Aluminium Alloy and Thermoplastic in the selection process. AHP method was used to determine the weight of the selection criteria, followed by TOPSIS method to perform the ranking of alternatives. The results showed that PPE/PA/989 resin was the best material for the automotive fender based on the criteria chosen. The integrated AHP-TOPSIS approach is proven effective in assisting engineers in evaluating and determining the best material for the automotive fender which involve many criteria and alternatives in the material selection process.

KEYWORDS: Material Selection, Automotive Fender, Lightweight, AHP, TOPSIS.

### 1.0 INTRODUCTION

In recent years, new materials are used to replace traditional materials to achieve weight reduction and performance improvement in engineering application especially in automotive industry [1]. Currently, materials such as advanced steels, magnesium alloys, aluminium alloys and titanium alloys, plastics and composites are used in automotive industry to produce lightweight vehicles. New trends of lightweight vehicles not only can enhance fuel efficiency but can also lower the emissions for the driving performance improvement [2]. Reducing the weight of vehicle can cause a significant reduction of vehicle power requirement, hence, increasing
the fuel economy. Studies have shown that every $10 \%$ of vehicle weight reduction can cause 5 to $8 \%$ greater fuel efficiency [3]. Weight reduction of automotive components becomes a new trend because it can meet the customer expectation in terms of fuel economy, emission reduction, vehicles safety and performance. Redesigning existing components with lightweight materials is one method to reduce weight in vehicle body construction. Weight saving in automotive components such as power-train, chassis and suspension, body panels and body structure might be achieved by using lightweight materials to replace high density materials like steels [4].

An Analytic Hierarchy Process (AHP) which was developed by Saaty in the 1970s has proven its efficiency in decision making process and has been widely used in manufacturing and production systems, business planning, economic planning, conflict resolution, logistics and capital budgeting [5-6]. The AHP hierarchy model enables a decision maker to break a complex problem into smaller subproblems. Objectives, criteria and sub-criteria are structured from the highest to lowest level of the model which can help decision makers to understand the problem in-depth. Pair-wise comparison between sub-criteria or alternatives at the same level with respect to the objectives or criterion at the higher level can reduce the inconsistencies that are made possible by the decision makers. The AHP also helps the decision makers to evaluate the relative importance of the multiple criteria. The relative weightage of each criterion tells the decision makers which criterion is the most important and selects the highest weighted criteria as the best alternatives [7].

Furthermore, Hwang and Yoon proposed TOPSIS method for solving MCDM problem with several alternatives [8]. This method states that an alternative which has the shortest distance from the positive ideal solution (PIS) and the longest distance from the negative ideal solution (NIS) is the most appropriate alternative. The alternative has the maximum similarity with PIS and minimum similarity with NIS. PIS maximizes the benefit criteria and minimizes cost criteria, whereas NIS minimizes the benefit criteria and maximizes the cost criteria. The TOPSIS method is very useful in material selection decision making process because it is a quick and easy decision where its ranking output gives a better understanding of similarities and differences among alternatives [9]. TOPSIS has been applied in many multi criteria decision making processes in different applications such as engineering, design and manufacturing system [10]. The integrated AHP and TOPSIS was employed owing to its capability in providing
a structure and hierarchy method for synthesizing selection problems and to rank the alternative or decision options based on their overall performance [12].

An integrated AHP-TOPSIS is one of the multiple-criteria decision making problem (MCDM) methods that can be implemented in solving the material selection problem. Various case studies are conducted to assist decision makers in determining the best decision in various engineering perspectives [7], [11-13]. Thus, this paper presented an approach of evaluating and determining the best material for the automotive fender design using an integrated AHPTOPSIS.

### 2.0 METHODOLOGY

The materials considered for the automotive fender design were High Strength Steels (Docol600DP and Docol1000DP), Aluminium alloys (AA2036T4 and AA6010T4) and Thermoplastic polymers (PPE/PA/989Resin, PPO/PA66, NY66/40CF, PPS/40CF, AR/PC, $\mathrm{PC} / \mathrm{PBT}$ resin). The material properties that were required for the material selection were Density (D), Ultimate Tensile Strength (UTS), Yield Strength (YS), Elongation at Break (EB), Young's Modulus (YM), Izod Impact, Notched (IP), Electrical Resistivity (ER), Linear Coefficient of Thermal Expansion (CTE), Specific Heat capacity (SHC) and Material Cost (MC). The material properties of the candidate materials are shown in Table 1. Table 2 summarizes the decision criteria used in the AHP-TOPSIS analysis for the material selection of the automotive fender design. There were two stages of conducting the integrated approach as discussed below:

### 2.1 Stage 1: Weighting of Criteria using AHP Method

Step 1: A hierarchy framework was developed which consisted of four levels. Goal, criteria, sub-criteria and alternatives were structured from the highest to lowest level of the model. A four level hierarchy decision process is shown in Figure 1.

Table 1: Material properties of candidate materials [14]

| Material Properties | Candidate Materials |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { D600 } \\ \text { DP } \end{gathered}$ | $\begin{gathered} \text { D1000 } \\ \text { DP } \end{gathered}$ | $\begin{gathered} \text { AA } \\ 2036 \\ \text { T4 } \end{gathered}$ | $\begin{gathered} \text { AA } \\ 6010 \\ \text { T4 } \end{gathered}$ | $\begin{gathered} \hline \text { PPE/ } \\ \text { PA/ } \\ 989 \end{gathered}$ | $\begin{aligned} & \mathrm{PPO} / \\ & \text { PA66 } \end{aligned}$ | $\begin{aligned} & \text { NY66/ } \\ & \text { 40CF } \end{aligned}$ | $\begin{aligned} & \text { PPS/ } \\ & 40 \mathrm{CF} \end{aligned}$ | $\begin{gathered} \mathrm{AR} / \\ \mathrm{PC} \end{gathered}$ | $\begin{aligned} & \mathrm{PC} / \\ & \text { PBT } \end{aligned}$ |
| Physical Properties |  |  |  |  |  |  |  |  |  |  |
| D (g/cc) | 7.9 | 7.9 | 2.7 | 2.7 | 0.9 | 1.3 | 1.5 | 1.5 | 1.2 | 1.3 |
| Mechanical Properties |  |  |  |  |  |  |  |  |  |  |
| UTS (MPa) | 650.0 | 1100.0 | 338.0 | 290.0 | 55.0 | 53.0 | 267.0 | 175.0 | 49.8 | 54.0 |
| YS (MPa) | 400.0 | 850.0 | 193.0 | 170.0 | 60.0 | 54.0 | 120.0 | 143.0 | 56.3 | 58.0 |
| EB (\%) | 16.0 | 7.0 | 24.0 | 24.0 | 40.0 | 2.2 | 6.7 | 0.8 | 26.7 | 120.0 |
| E (GPa) | 207.0 | 207.0 | 71.0 | 69.0 | 2.3 | 4.5 | 24.6 | 32.8 | 2.2 | 3.8 |
| IP (J/cm) | 57.5 | 57.5 | 8.5 | 8.5 | 2.4 | 0.4 | 1.6 | 0.5 | 9.4 | 2.5 |
| Electrical Properties |  |  |  |  |  |  |  |  |  |  |
| $\begin{aligned} & \text { ER } \\ & (\mu \mathrm{ohm}-\mathrm{cm}) \end{aligned}$ | 20.0 | 23.0 | 4.12 | 4.4 | $5 \mathrm{E}+1$ | $3 \mathrm{E}+2$ | 1E+14 | $1 \mathrm{E}+1$ | $2 \mathrm{E}+1$ | $3 \mathrm{E}+2$ |
| Thersal Properties |  |  |  |  |  |  |  |  |  |  |
| $\begin{aligned} & \text { CTE } \\ & \left(\mu \mathrm{m} / \mathrm{m}-{ }^{\circ} \mathrm{C}\right) \\ & \hline \end{aligned}$ | 10.8 | 11.7 | 23.4 | 24.8 | 85.0 | 64.8 | 14.8 | 17.3 | 93.6 | 46.0 |
| $\begin{aligned} & \hline \text { SHC } \\ & \left(\mathrm{J} / \mathrm{kg} .{ }^{\circ} \mathrm{C}\right) \\ & \hline \end{aligned}$ | 460.0 | 486.0 | 882.0 | 890.0 | 1700.0 | 1630.0 | 1520.0 | 1330.0 | 1580.0 | 1420.0 |

Table 2: Decision criteria used in AHP-TOPSIS for the material selection of automotive fender

| Goal: To select the best material for automotive fender |  |  |
| :---: | :---: | :---: |
| Main Criteria | Corresponding material properties as sub-criteria | Aim |
| (i) <br> Performance | Ultimate tensile strength, Yield strength, Young modulus and Izod impact | Maximum value to provide the required structural strength of the final material. |
|  | Elongation at break | Maximum value to allow improved performance in term of deformation under physical loadings for the final material. |
|  | Coefficient of thermal expansion | Minimum value to allow improved performance in term of deformation under thermal loadings for the final material. |
| (ii) <br> Cost | Material cost | Minimum value to achieve lowest product cost specifically in term of material cost. |
| (iii) <br> Weight | Density | Minimum value to attain lightweight property for the final material. |
| (iv) <br> Manufacturing | Electrical resistivity | Minimum value to conduct electricity uring online painting. |
|  | Specific heat capacity | Maximum value to withstand the high temperatures of online painting. |

Figure 1: A hierarchy framework for the material selection
Step 2: The pair-wise comparison of main criteria with respect to the goal was constructed in Table 4 based on the Saaty rating scale (Table 3). For judgements in the first row, if Performance was equally important to itself, rate 1 was assigned. If Performance was much more important over Cost, rate 5 was assigned. If Weight was somewhat more important than Performance, rate $1 / 3$ was assigned. Reciprocals value was automatically assigned to inverse comparison.

Table 3: Saaty rating scale for pair-wise comparison [5]

| Intensity of <br> importance | Definition | Explanation |
| :---: | :--- | :--- |
| 1 | Equal importance | Two factors contribute equally to the objective |
| 3 | Somewhat more important | Experience and judgment slightly favor one over the other |
| 5 | Much more important | Experience and judgment strongly favor one over the other |
| 7 | Very much more important | Experience and judgment very strongly favor one over the other. Its <br> importance is demonstrated in practice |
| 9 | Absolutely more important | The evidence favoring one over the other is of the highest possible validity |
| $2,4,6,8$ | Intermediate values | When compromise is needed |

Table 4: Pair-wise of main criteria

| Main Criteria | $\mathbf{P}$ | $\mathbf{C}$ | $\mathbf{W}$ | $\mathbf{M}$ |
| :---: | :---: | :---: | :---: | :---: |
| P | 1 | 5 | $1 / 3$ | 3 |
| C | $1 / 5$ | 1 | $1 / 7$ | $1 / 2$ |
| W | 3 | 7 | 1 | 5 |
| M | $1 / 3$ | 2 | $1 / 5$ | 1 |
| $\Sigma$ | 4.5333 | 15.0000 | 1.6762 | 9.5000 |

Step 3: The pair-wise comparison was synthesized by calculating priority vector. The Priority Vector (PV) or Eigenvectors (w) was calculated using.

$$
\begin{equation*}
w=\frac{1}{n} \sum_{j=1}^{n} \frac{a_{i j}}{\sum_{i=1}^{a} a_{i j}}, \quad i, j=1,2, \ldots, n \tag{1}
\end{equation*}
$$

Where $w$ is the priority vector (or eigenvector), $n$ is the number of criteria, and $a_{i j}$ is the importance scale, i.e. $1,3,5 \ldots n$.

The Priority Vector in the first row was calculated as $1+1 / 5+3+1 / 3=$ $4.5333 ; 1 / 4.5333=0.2206 ; 0.2206+0.3333+0.1989+0.3158=1.0686$; divide the sum of row by the number of elements $(n=4)$ hence, $1.0686 / 4=0.2671$. The calculation is summarized in Table 5.

Table 5: Synthesized pair-wise comparison and priority vector

| Main Criteria | P | C | W | M | Total Row | PV |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| P | 0.2206 | 0.3333 | 0.1989 | 0.3158 | 1.0686 | 0.2671 |
| C | 0.0441 | 0.0667 | 0.0852 | 0.0526 | 0.2486 | 0.0622 |
| W | 0.6618 | 0.4667 | 0.5966 | 0.5263 | 2.2513 | 0.5628 |
| M | 0.0735 | 0.1333 | 0.1193 | 0.1053 | 0.4314 | 0.1079 |
| $\Sigma$ |  |  |  |  |  | 1.0000 |

Next, the overall consistency ratio, $C R$ for the overall judgements was calculated based on the principle of Eigenvalues, Consistency Index, CI and Relative Index, RI.

Step 4: The Eigenvalue ( $\lambda_{\text {max }}$ ) could be calculated using Equation (2). The right matrix of judgements was multiplied by the priority vector (PV) to obtain a new vector (NV). The calculation to get a new vector is summarized in Table 6.

$$
\begin{equation*}
\text { Eigenvalue, } \lambda_{\max }=\sum_{i=1}^{n} \frac{\sum_{j=1}^{n} a_{i j} \times w_{j}}{w_{i}} i, j=1,2, \ldots, n \tag{2}
\end{equation*}
$$

Table 6: Calculated the Eigenvalue ( $\lambda_{m a x}$ )

| PV | P | PV | C | PV | W | PV | M | New Vector | NV/PV |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0.2671 | 1 | 0.0622 | 5 | 0.5628 | 1/3 | 0.1079 | 3 | 1.0891 | 4.0770 |
|  | 1/5 |  | 1 |  | 1/7 |  | 1/2 | 0.2500 | 4.0188 |
|  | 3 |  | 7 |  | 1 |  | 5 | 2.3390 | 4.1560 |
|  | 1/3 |  | 2 |  | 1/5 |  | 1 | 0.4339 | 4.0213 |
| Total ( $\Sigma$ ) |  |  |  |  |  |  |  |  | 16.2731 |
| $\chi_{\text {max }}$ |  |  |  |  |  |  |  |  | 4.0683 |

The calculation of the first row in the matrix was $0.2671(1)+0.0622(5)+0.5628(1 / 3)+0.1079(3)=1.0891$.

Then, dividing all the elements of the new vector by their respective priority vector element, hence
$1.0891 / 0.2671=4.0070 ; 0.2500 / 0.0622=4.0188 ; 2.3390 / 0.5628=4.1560$;
$0.4339 / 0.1079=4.0213$.

Next, calculate the average of these values to obtain $\lambda_{\max }=(4.0770+4.0188+4.1560+4.0213) / 4=4.0683$.

Step 5: The Consistency Index (CI) could be calculated using

$$
\begin{equation*}
\mathrm{CI}=(\lambda \max -\mathrm{n}) /(\mathrm{n}-1) \tag{3}
\end{equation*}
$$

Where n is the matrix size, $\mathrm{CI}=(4.0683-4) /(4-1)=0.0228$.
Step 6: The Consistency Ratio (CR) could be calculated using

$$
\begin{equation*}
\mathrm{CR}=\mathrm{CI} / \mathrm{RI} . \tag{4}
\end{equation*}
$$

The value of random index (RI) was selected by referring to the matrix size shown in Table 7. For the matrix size $n=4$, RI $=0.9$, the consistency ratio was calculated as $\mathrm{CR}=\mathrm{CI} / \mathrm{RI}=0.0228 / 0.9=0.0253$. As the CR value obtained was less than 0.1 , the judgements were acceptable. If CR value obtained was more than 0.1 , the judgements were inconsistent. Then, the pair-wise judgements should be reviewed and improved. The summary of the results as shown in Table 8.

Table 7: Random Index [5]

| Size of matrix (n) | $\underline{1}$ | $\underline{2}$ | $\underline{3}$ | $\underline{4}$ | $\underline{5}$ | $\underline{6}$ | $\underline{7}$ | $\underline{8}$ | $\underline{9}$ | 10 | 11 | 12 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Random Index (I) | 0 | 0 | 0.58 | 0.9 | 1.12 | 1.24 | 1.32 | 1.41 | 1.45 | 1.49 | 1.51 | 1.58 |

Table 8: Consistency test for main criteria

| Goal | Priority Vector | New Vector |
| :---: | :---: | :---: |
| P | 0.2671 | 1.0891 |
| C | 0.2671 | 0.25 |
| W | 0.2671 | 2.339 |
| M | 0.2671 | 0.4339 |
| Consistency Test |  |  |
| $\lambda_{\max }$ |  | 4.0683 |
| CI |  |  |
| RI |  | 0.0228 |
| CR |  |  |

The pair-wise comparison and consistency analysis were performed for the sub-criteria in the hierarchy model. Tables 9 and Table 10 represent the consistency test for sub-criteria with respect to their corresponding Performance and Manufacturing main criteria.

Table 9: Consistency test for sub-criteria of performance

| Performance | UTS | YS | EB | YM | IP | CTE | PV | NV | NV/PV |

### 2.2 Stage 2: Ranking of Alternatives using TOPSIS Method

Step 1: Normalized decision matrix was calculated using

$$
\begin{equation*}
n_{i j}=\frac{x_{i j}}{\sqrt{\sum_{j=1}^{m} X_{i j}^{2}}} \text { where } i=1, \ldots, m \text {, and } j=1, \ldots, \tag{5}
\end{equation*}
$$

Where $X_{\mathrm{ij}}$ and $\mathrm{n}_{\mathrm{ij}}$ are original and normalized score of decision matrix, respectively

First, modified decision matrix was calculated and shown in Table 11. The modified decision matrix for UTS sub-criteria was calculated as
$650^{2}+1100^{2}+338^{2}+290^{2}+55^{2}+53^{2}+267^{2}+175^{2}+49.8^{2}+54^{2}=1.94 \mathrm{E}+06 ; \sqrt{ } 1.94 \mathrm{E}+06=$ $1.39 \mathrm{E}+03$.

The normalized decision matrix for the sub-criteria was calculated and tabulated in Table 12. The normalized decision matrix for D600DP with the sub-criteria was calculated as
$650 / 1.39 \mathrm{E}+03=0.4662 ; 400 / 9.98 \mathrm{E}+02=0.4007 ; 16 / 1.35 \mathrm{E}+02=0.1185$;
$207 / 3.12 \mathrm{E}+02=0.6639 ; 57.5 / 8.28 \mathrm{E}+01=0.6941 ; 10.8 / 1.56 \mathrm{E}+02=0.0694$;
$0.81 / 2.87 \mathrm{E}+01=0.0282 ; 7.87 / 1.22 \mathrm{E}+01=0.6442 ; 20 / 4.76 \mathrm{E}+20=4.29 \mathrm{E}-20$;
$460 / 4.02 \mathrm{E}+03=0.1144$.
Step 2: Weighted normalized decision matrix was determined using

$$
V=N_{D} \cdot W_{n \times n}=\left|\begin{array}{ccccc}
V_{1 i} & \cdots & V_{1 j} & \cdots & V_{1 n}  \tag{6}\\
\vdots & & \vdots & & \vdots \\
V_{m 1} & \cdots & V_{m i} & \cdots & V_{m n}
\end{array}\right|
$$

The weighted normalized decision matrix ( $V$ ) multiplied the normalized decision matrix ( $N_{D}$ ) by the weighted priority ( $W_{n \times n}$ ) as shown in Table 13. The weighted normalized decision matrix for D600DP with the sub-criteria was calculated as

$$
\begin{aligned}
& 0.4662(0.0470)=0.0219 ; 0.4007(0.0470)=0.0188 ; 0.1185(0.0105)=0.0012 ; \\
& 0.6639(0.1049)=0.0696 ; 0.6941(0.0384)=0.0266 ; 0.0694(0.0193)=0.0013 ; \\
& 0.0282(0.0622)=0.0018 ; 0.6442(0.5628)=0.3626 ; 4.29 \mathrm{E}-20(0.0270)=1.16 \mathrm{E}-21 ; \\
& 0.1144(0.0809)=0.0093
\end{aligned}
$$

Step 3: Positive Ideal Solution (PIS) and Negative Ideal Solution (NIS) could be expressed as Equation (7) and Equation (8). PIS was the best solution and the NIS was the worst solution.

$$
\begin{align*}
& A^{+}=\left\{\left(\max _{i} v_{i j} ; i \in I\right)\left({ }_{i}^{\min } v_{i j} ; i \in J\right) ; i=1,2, \ldots, n\right\}  \tag{7}\\
& A^{-}=\left\{\left(\min _{i} v_{i j} ; i \in I\right)\left(\max _{i} v_{i j} ; i \in J\right) ; i=1,2, \ldots, n\right\} \tag{8}
\end{align*}
$$

For example, higher Ultimate Tensile Strength (UTS) was required for the automotive fender. A largest value of UTS was the best compared to a smallest value. Hence, PIS was the maximum value and NIS was the minimum value. However, lower Density (D) was required for a light weight automotive fender. A smallest value of D was the best compared to a largest value. Hence, PIS was the minimum value and NIS was the maximum value. The PIS and NIS values are shown in Table 14.

Table 14: PIS and NIS

| Sub-Criteria | PIS | NIS |
| :---: | :---: | :---: |
| UTS | 0.0371 | 0.0017 |
| YS | 0.0400 | 0.0025 |
| EB | 0.0094 | 0.0001 |
| YM | 0.0696 | 0.0007 |
| IP | 0.0266 | 0.0002 |
| CTE | 0.0013 | 0.0116 |
| MC | 0.0018 | 0.0441 |
| D | 0.0451 | 0.3626 |
| ER | $2.40 \mathrm{E}-22$ | 0.0191 |
| SHC | 0.0342 | 0.0093 |

Table 11: Modified decision matrix

Step 4: The separation of each alternative from the ideal solution was given as Equation (9) and Equation (10).

$$
\begin{align*}
& d_{i^{+}}=\left\{\sum_{j=1}^{n}\left(v_{i j}-v_{j}+\right)^{1 / 2} ; i=1,2, \ldots, m\right\}  \tag{9}\\
& d_{i^{-}}=\left\{\sum_{j=1}^{n}\left(v_{i j}-v_{j^{-}}\right)^{1 / 2} ; i=1,2, \ldots, m\right\} \tag{10}
\end{align*}
$$

Where, $\mathrm{i}=$ criterion index and $\mathrm{j}=$ alternative index
The separation from PIS was the distance of each alternative separate from the PIS value of each sub-criterion as shown in Table 15. Taking D600DP as an example, the separation from PIS and NIS was calculated as

```
di+Dg00DP
=(0.0219-0.0371) 2+(0.0188-0.0400) 2+(0.0012-0.0094)2+(0.0696-0.0696) 2
+(0.0266-0.0266) 2+(0.0013-0.0013)}\mp@subsup{)}{}{2+(0.0018-0.0018)2+(0.3626-0.0451)}\mp@subsup{}{}{2
+(1.16E-21-2.40E-22)2+(0.0093-0.0342)}\mp@subsup{}{}{2
= 0.1021
di-D600DP
=(0.0219-0.0017)2+ (0.0188-0.0025)2+ (0.0012-0.0001) 2+ (0.0696-0.0007)}\mp@subsup{)}{}{2
+(0.0266-0.0002)}\mp@subsup{)}{}{2}+(0.0013-0.0116\mp@subsup{)}{}{2}+(0.0018-0.0441)2+(0.3626-0.3626) 2
+(1.16E-21-0.0191)2+(0.0093-0.0093)}\mp@subsup{}{}{2
= 0.0084
```

Table 15: Separation from PIS and NIS

| Alternatives | Separation from PIS, $\mathrm{di}^{+}$ | Separation from NIS, di |
| :--- | :---: | :---: |
| D600DP | 0.1021 | 0.0084 |
| D1000DP | 0.1014 | 0.0104 |
| AA2036T4 | 0.0118 | 0.0572 |
| AA6010T4 | 0.0118 | 0.0579 |
| PPE/PA/989 | 0.0082 | 0.1028 |
| PPO/PA66 | 0.0088 | 0.0931 |
| NY66/40CF | 0.0073 | 0.0868 |
| PPS/40CF | 0.0087 | 0.0868 |
| AR/PC | 0.0082 | 0.0969 |
| PC/PBT | 0.0086 | 0.0936 |

Step 5: Finally, the relative closeness ( $\mathrm{cl}_{\mathrm{i}}$ ) to the ideal solution for every alternative was determined using Equation (11). The ranking of alternatives was finally made by ranking the preference in decreasing order based on the indices as shown in Table 16.
$c l_{i^{+}}=\frac{d_{i^{-}}}{\left(d_{i^{+}}-d_{i^{-}}\right)}, 0 \leq c l_{i^{+}} \leq 1 ; i=1,2, \ldots, m$
The Relative Closeness of the alternatives was calculated as

$$
\begin{aligned}
& 0.0084 /(0.1021+0.0084)=0.0759 ; 0.0104 /(0.01014+0.0104)=0.0927 ; \\
& 0.0572 /(0.0118+0.0572)=0.8293 ; 0.0579 /(0.0118+0.0579)=0.8310 ; \\
& 0.1028 /(0.0082+0.1028)=0.9259 ; 0.0931 /(0.0088+0.0931)=0.9137 ; \\
& 0.0868 /(0.0073+0.0868)=0.9223 ; 0.0868 /(0.0087+0.0868)=0.9084 ; \\
& 0.0969 /(0.0082+0.0969)=0.9220 ; 0.0936 /(0.0086+0.0936)=0.9158
\end{aligned}
$$

Table 16: Relative closeness

| Alternatives | Relative Closeness | Ranking |
| :--- | :---: | :---: |
| D600DP | 0.0759 | 10 |
| D1000DP | 0.0927 | 9 |
| AA2036T4 | 0.8293 | 8 |
| AA6010T4 | 0.8310 | 7 |
| PPE/PA/989 | 0.9259 | 1 |
| PPO/PA66 | 0.9137 | 5 |
| NY66/40CF | 0.9223 | 2 |
| PPS/40CF | 0.9084 | 6 |
| AR/PC | 0.9220 | 3 |
| PC/PBT | 0.9158 | 4 |

### 3.0 RESULTS AND DISCUSSIONS

The results of AHP analysis were obtained from Expert Choice ${ }^{\mathrm{TM}}$ software. The pair-wise comparison of the main criteria with respect to goal is shown in Figure 2. The inconsistency value obtained was 0.03 , which was less than 0.1 , hence, the judgments were acceptable.

Figure 2: Pair-wise comparison of the main criteria in graphical
The pair-wise comparison for the sub-criteria of Performance and Manufacturing are shown in Figure 3 and Figure 4. The inconsistency values obtained were 0.02 and 0.00 respectively, which were less than 0.1 , hence, the judgements were acceptable.

Figure 3: Pair-wise comparison of the Performance sub-criteria

Figure 4: Pair-wise comparison of the Manufacturing sub-criteria
Local Weight (L) represented the priority of each sub-criterion with respect to their corresponding main criteria. Global Weight (G) represented the priority of each sub-criterion with respect to the goal. The Local Weight and Global Weight are shown in Figure 5.

| - Performance (L: . 264 G: . 264) |
| :---: |
| $\square$ UTS (L: . $175 \mathrm{G}: ~ .046$ ) |
|  |
| $\bigcirc E B$ (L: . $039 \mathrm{G}: .010$ ) |
| - YM (L: . 397 G : . 105 ) |
| $\bigcirc$ IP (L: $144 \mathrm{G}: .038)$ |
| $\square$ - CTE (L: . $071 \mathrm{G}: ~ .019)$ |
| $\square \operatorname{Cost}$ (L: . $061 \mathrm{G:} \mathrm{.061)}$ |
| $\square$ Weight (L: . $569 \mathrm{G}: .569$ ) |
| $\longrightarrow$ Manufacturing (L: .106 G: .106) |
| - ER (L: . $250 \mathrm{G}: .026$ ) |
| $\square$ SHC (L: . $750 \mathrm{G}: ~ .079)$ |

Figure 5: Global weight of the sub-criteria
The overall priority of sub-criteria with respect to goal were Weight (0.569), YM (0.105), SHC (0.079), Cost (0.0610), UTS (0.046), YS (0.046), IP (0.038), ER (0.026), CTE (0.019) and EB (0.010) as shown in Figure 6. The priority vector was the weightage of the sub-criteria with respect to the goal obtained in AHP analysis.

Synthesis with respect to:

Figure 6: Priority of the sub-criteria with respect to the goal
Finally, the ranking of the alternatives using TOPSIS analysis is shown in Table 17. The alternative at the top of ranking was material PPE/PA/989 with the highest relative closeness of 0.9259 . The ranking was followed by NY66/40CF, AR/PC, PC/PBT, PPO/PA66, PPS/40CF, AA6010T4, AA2036T4, D1000DP and D600DP.

Table 17: Ranking of alternatives

| Alternatives | Relative Closeness | Ranking |
| :--- | :---: | :---: |
| PPE/PA/989 | 0.9259 | 1 |
| NY66/40CF | 0.9223 | 2 |
| AR/PC | 0.9220 | 3 |
| PC/PBT | 0.9158 | 4 |
| PPO/PA66 | 0.9137 | 5 |
| PPS/40CF | 0.9084 | 6 |
| AA6010T4 | 0.8310 | 7 |
| AA2036T4 | 0.8293 | 8 |
| D1000DP | 0.0927 | 9 |
| D600DP | 0.0759 | 10 |

### 4.0 CONCLUSION

In conclusion, the material selection of the automotive fender was very important. A lightweight material used for the automotive fender could enhance fuel economy, lowered emission and improved driving performance of the automotive vehicle. There are ten (10) important criteria considered in the material selection of the automotive fender such as low weight, high stiffness, high specify heat capacity, low cost, high ultimate tensile strength, high yield strength, high impact strength, low electric resistivity, low coefficient thermal expansion and high elongation at break. Besides that, the integrated AHP-TOPSIS method is successfully proven in multicriteria decision making processes which involve many criteria and alternatives in the material selection of the automotive fender. From the ten (10) proposed lightweight materials, the PPE/PA/989 resin is selected as the best alternative based on its performance, weight, cost and manufacturing perspective. Indeed, the PPE/PA/989 resin is selected as the best material for the automotive fender using integrated AHP-TOPSIS method.

## ACKNOWLEDGEMENTS

The authors are sincerely grateful to Universiti Teknikal Malaysia Melaka (UTeM) for funding this research project.
